ACOUSTIC SENSING USING YOUR SMARTPHONE

Acoustic Hardware

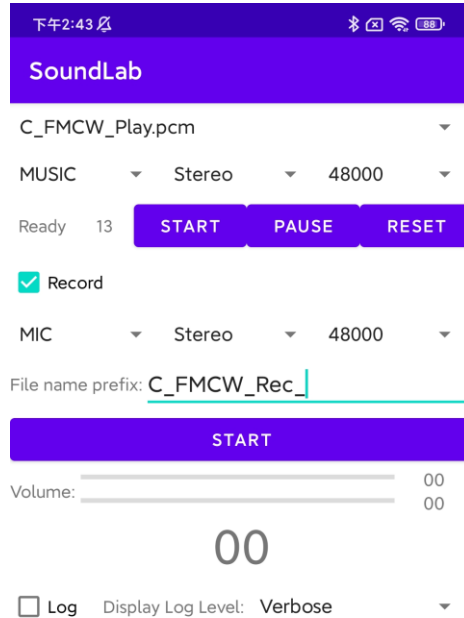

(a) Sound recording system.

(b) Sound playback system.

Fig. 2: Diagrams for typical acoustic hardware.

SoundLab for Android

GitHub link:

<https://github.com/LinLin1230/SoundLab>

Sampling rate: 48e3 Hz

Mono: 单声道

Stereo: 双声道

MUSIC: 上下扬声器

CALL: 听筒

PCM: Pulse-code modulation

PCM Playback

Put pcm file in the path `~/SoundLab/Playlist`

PCM Recording

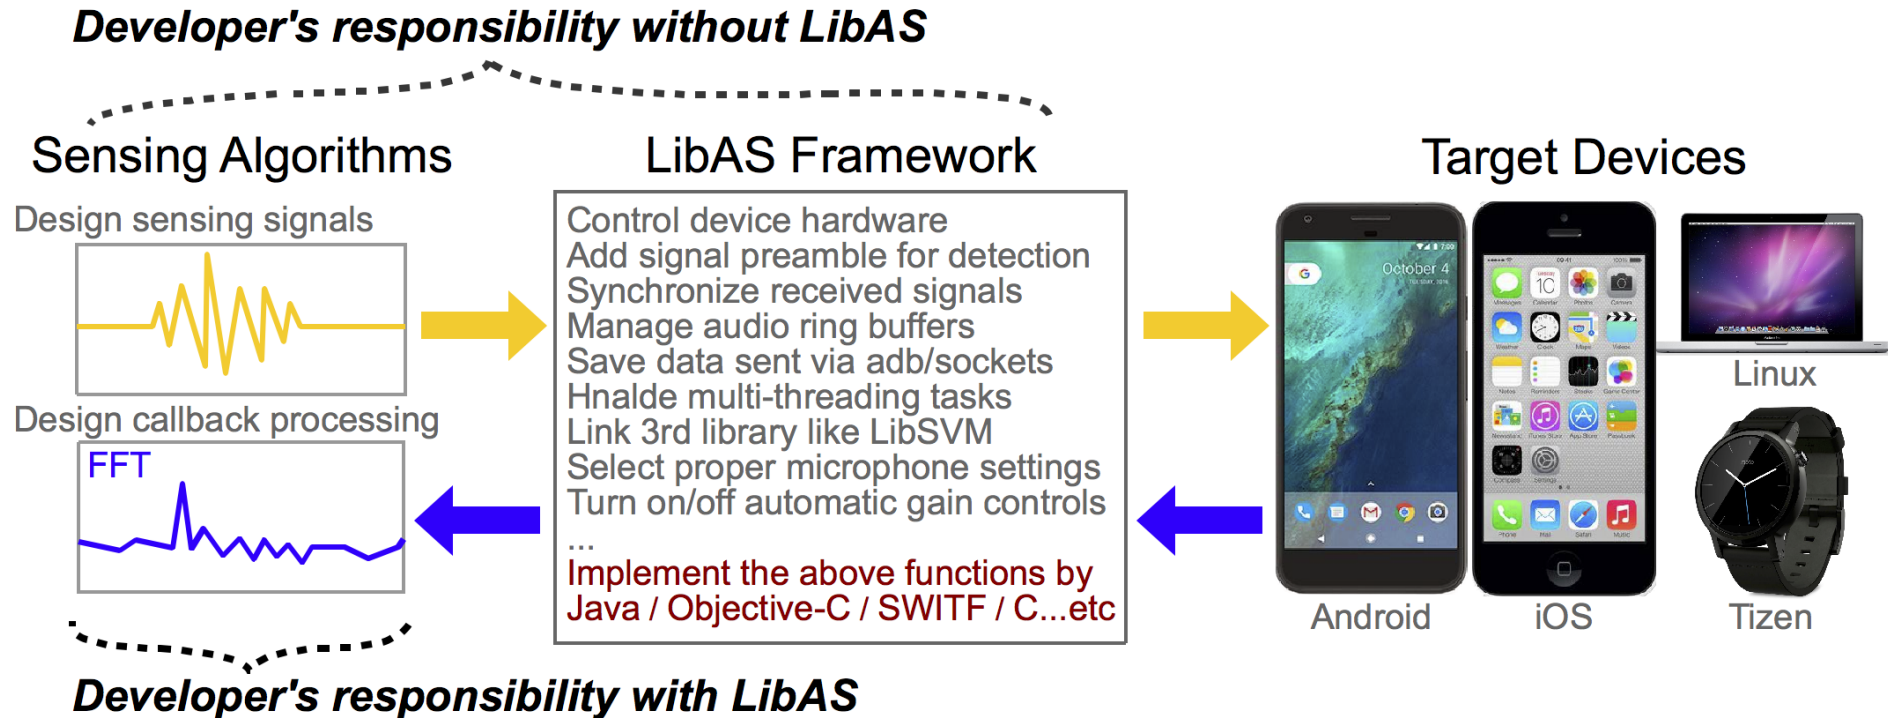

Recorded PCM files are stored in the path ~/SoundLab/

LibAS for IOS (Optional)

GitHub link:

<https://github.com/yctung/LibAcousticSensing>

PHASE-BASED DISTANCE TRACKING THEORY

Device-free Gesture Tracking

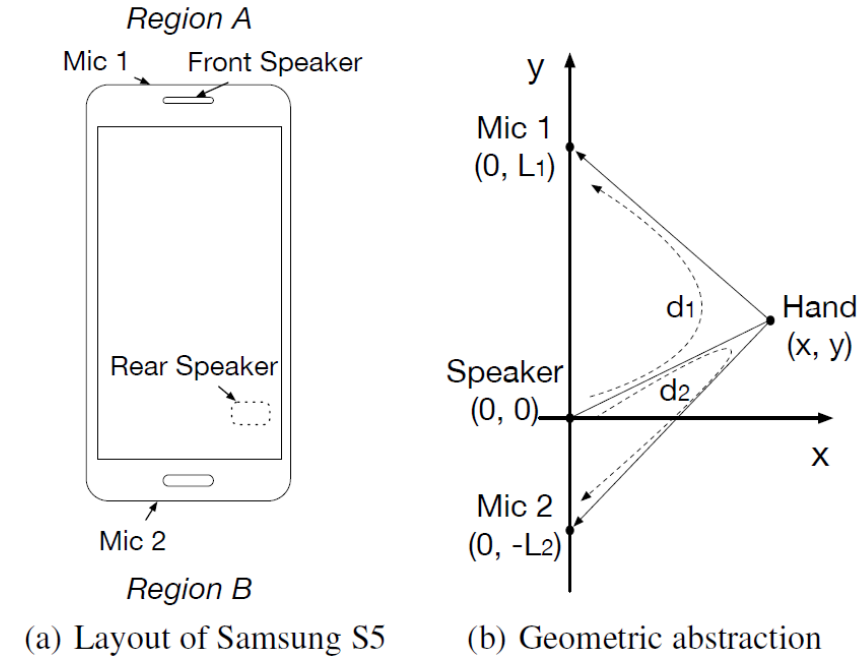

Figure 9: Two dimensional tracking

Acoustic signals are transmitted by speaker, reflected by hand/finger, received by microphone.
Use the link below to see a demo:

<https://www.youtube.com/watch?v=gs8wMrOSY80>

Phase-based Distance Tracking

coherent detector structure

- The sound reflected by a human hand is coherent to the sound emitted by the mobile device. They have a constant phase difference and the same frequency.
- We use a coherent detector to convert the received sound signal into a complex-valued baseband signal.

Phase-based Distance Tracking

coherent detector structure

Transmitted signal:

$$A \cos(2\pi f t)$$

Received signal (after reflection via path p):

$$2A'_p \cos\left(2\pi f t - 2\pi f \frac{d_p(t)}{c} - \theta_p\right)$$

$2A'_p$ – amplitude of the received signal

$d_p(t)$ – propagation distance of path p

c – sound speed

θ_p – phase caused by the hardware delay and phase inversion due to reflection

Phase-based Distance Tracking

- Received signal (after reflection via path p):

$$2A'_p \cos(2\pi f t - 2\pi f \frac{d_p(t)}{c} - \theta_p)$$

- Multiply this received signal with $\cos(2\pi f t)$:

$$\cos \alpha \cos \beta = \frac{1}{2} [\cos(\alpha + \beta) + \cos(\alpha - \beta)]$$

$$\begin{aligned}
 & 2A'_p \cos(2\pi f t - 2\pi f \frac{d_p(t)}{c} - \theta_p) \times \cos(2\pi f t) \\
 = & A'_p \left(\underbrace{\cos(-2\pi f \frac{d_p(t)}{c} - \theta_p)}_{\text{low-frequency part}} + \underbrace{\cos(4\pi f t - 2\pi f \frac{d_p(t)}{c} - \theta_p)}_{\text{high-frequency part}} \right)
 \end{aligned}$$

- A low-pass filter is then applied, the result is the In-phase signal:

$$I_p(t) = A'_p \cos(-2\pi f \frac{d_p(t)}{c} - \theta_p)$$

Quadrature signal are derived by multiply the received signal with $-\sin(2\pi f t)$:

$$Q_p(t) = A'_p \sin(-2\pi f \frac{d_p(t)}{c} - \theta_p)$$

$$\cos \alpha \sin \beta = \frac{1}{2} [\sin(\alpha + \beta) - \sin(\alpha - \beta)]$$

Phase-based Distance Tracking

$$I_p(t) = A'_p \cos\left(-2\pi f \frac{d_p(t)}{c} - \theta_p\right)$$
$$Q_p(t) = A'_p \sin\left(-2\pi f \frac{d_p(t)}{c} - \theta_p\right)$$

- Combining these two components as real and imaginary part of a complex signal, we have the complex baseband as follows:

$$B_p(t) = A'_p e^{-j(2\pi f \frac{d_p(t)}{c} - \theta_p)}$$

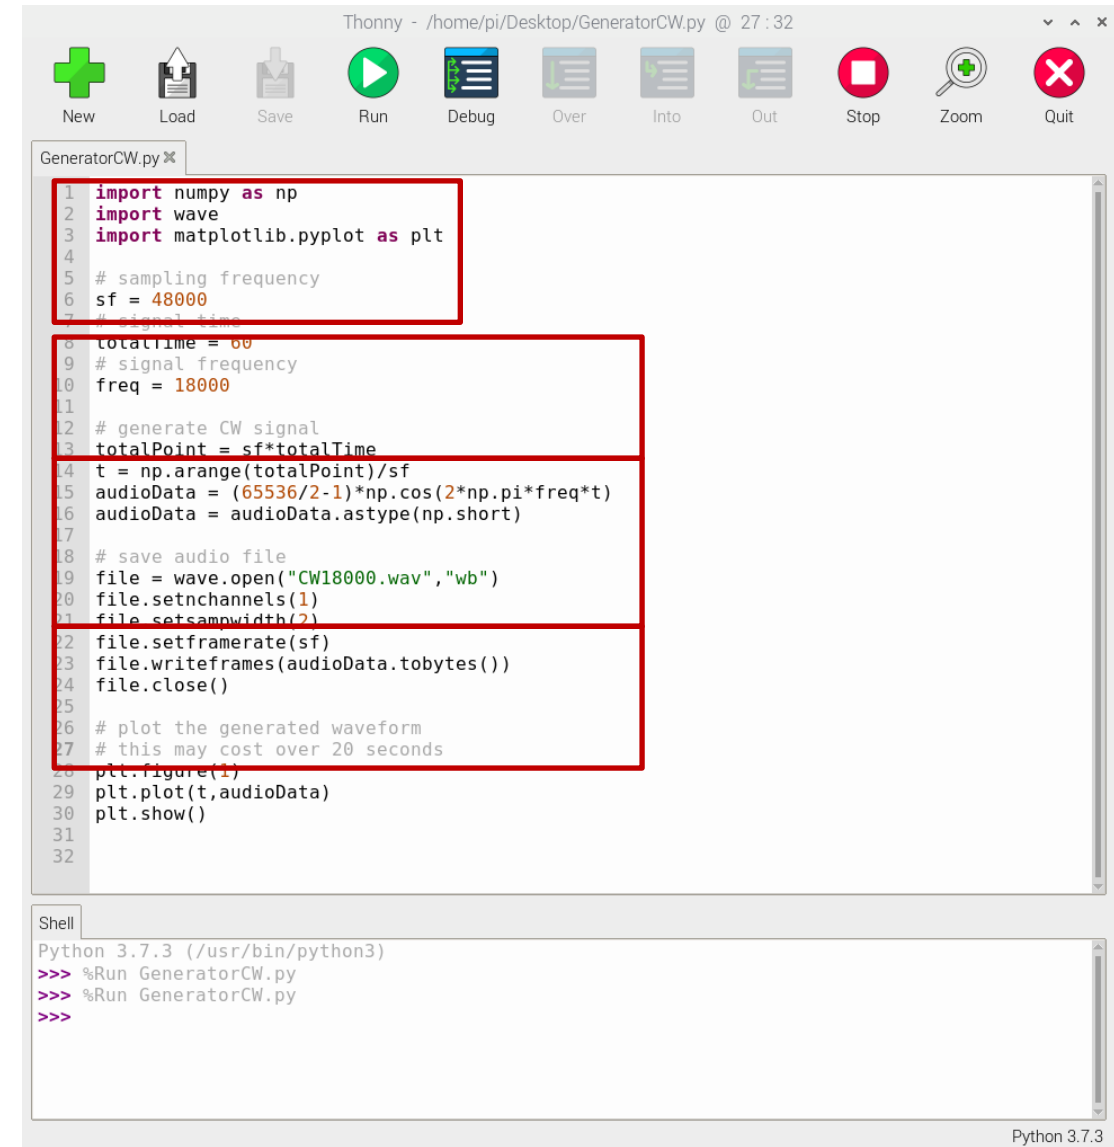

- The phase of it is:

$$\phi_p(t) = -2\pi f \frac{d_p(t)}{c} - \theta_p$$

- Note that when $d_p(t)$ changes by the amount of sound wavelength $\lambda = \frac{c}{f}$, the phase changes by 2π .

GenerateCW.py

- We use this file to generate a CW file.
- You can change “**frequency**” and “**totalTime**” to set signal frequency and signal time.

The screenshot shows the Thonny IDE interface. The top toolbar includes icons for New, Load, Save, Run, Debug, Over, Into, Out, Stop, Zoom, and Quit. The main editor window displays the code for GeneratorCW.py, with three sections highlighted by red boxes: the import statements (lines 1-3), the signal parameters and generation (lines 4-13), and the file saving and plotting (lines 14-32). The bottom shell window shows the execution of the script.

```
Thonny - /home/pi/Desktop/GeneratorCW.py @ 27:32

1 import numpy as np
2 import wave
3 import matplotlib.pyplot as plt
4
5 # sampling frequency
6 sf = 48000
7 # signal time
8 totalTime = 0.0
9 # signal frequency
10 freq = 18000
11
12 # generate CW signal
13 totalPoint = sf*totalTime
14 t = np.arange(totalPoint)/sf
15 audioData = (65536/2-1)*np.cos(2*np.pi*freq*t)
16 audioData = audioData.astype(np.short)
17
18 # save audio file
19 file = wave.open("CW18000.wav", "wb")
20 file.setnchannels(1)
21 file.setsampwidth(2)
22 file.setframerate(sf)
23 file.writeframes(audioData.tobytes())
24 file.close()
25
26 # plot the generated waveform
27 # this may cost over 20 seconds
28 plt.figure(1)
29 plt.plot(t, audioData)
30 plt.show()
31
32

Shell
Python 3.7.3 (/usr/bin/python3)
>>> %Run GeneratorCW.py
>>> %Run GeneratorCW.py
>>>
```

Python 3.7.3

A Demo

- We provide a demo to help you understand phase-based distance tracking.
- In this demo, the hand move 10 cm and move back.
- The derived distance tracking result is shown in figure.

Phase Demo

- There are two files:
 - “*Phase.py*” and “*PhaseDemo.wav*”

```
Thonny - /home/pi/Desktop/Phase.py @ 63 : 11
New Load Save Run Debug Over Into Out Stop Zoom Quit

Phase.py
1 import numpy as np
2 from scipy import signal
3 import wave
4 import matplotlib.pyplot as plt
5
6 # read audio file recorded by Raspberry Pi
7 file = wave.open("PhaseDemo.wav", "rb")
8 # get sampling frequency
9 sf = file.getframerate()
10 # get audio data total length
11 nLength = file.getnframes()
12 # read audio data
13 audioDataRaw = file.readframes(nLength)
14 # transfer to python list
15 audioDataRaw = list(audioDataRaw)
16 # transfer to numpy array
17 audioDataRaw = np.asarray(audioDataRaw, np.int8)
18 # set the data type to int16
19 audioDataRaw.dtype = "int16"
20 # calculate audio length in second
21 audioDataRawTotalTime = nLength/sf
22 # close the file
23 file.close()
24
25 # cut the middle part of the audio data
26 timeOffset = 2
27 totalTime = np.int32(np.ceil(audioDataRawTotalTime - timeOffset - 2))
28 totalPoint = totalTime*sf
29 timeOffsetPoint = timeOffset*sf
30 audioData = audioDataRaw[range(timeOffsetPoint, timeOffsetPoint+totalPoint)]
31
Shell
Python 3.7.3 (/usr/bin/python3)
>>>
```

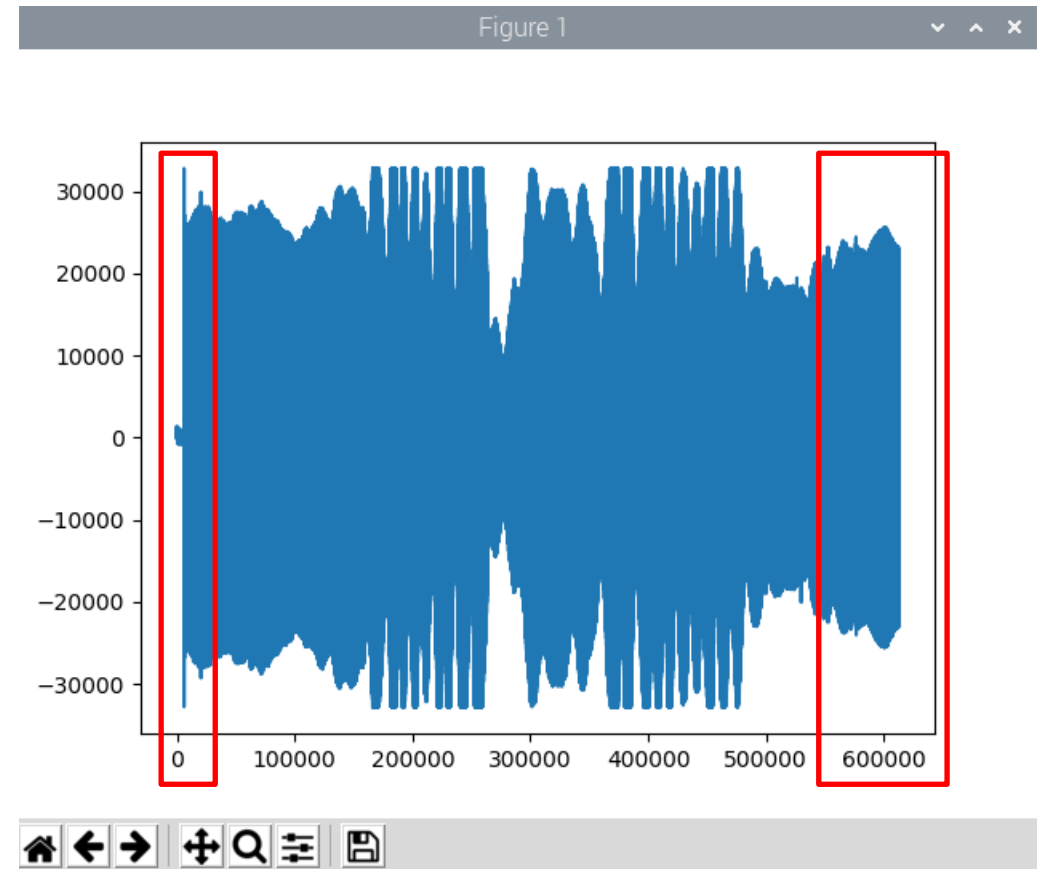

Read Audio File

- We first read the data file and convert data type.

```
# read audio file recorded by Raspberry Pi
file = wave.open("PhaseDemo.wav", "rb")
# get sampling frequency
sf = file.getframerate()
# get audio data total length
nLength = file.getnframes()
# read audio data
audioDataRaw = file.readframes(nLength)

# transfer to python list
audioDataRaw = list(audioDataRaw)
# transfer to numpy array
audioDataRaw = np.asarray(audioDataRaw, np.int8)
# set the data type to int16
audioDataRaw.dtype = "int16"
# calculate audio length in second
audioDataRawTotalTime = nLength/sf
# close the file
file.close()
```

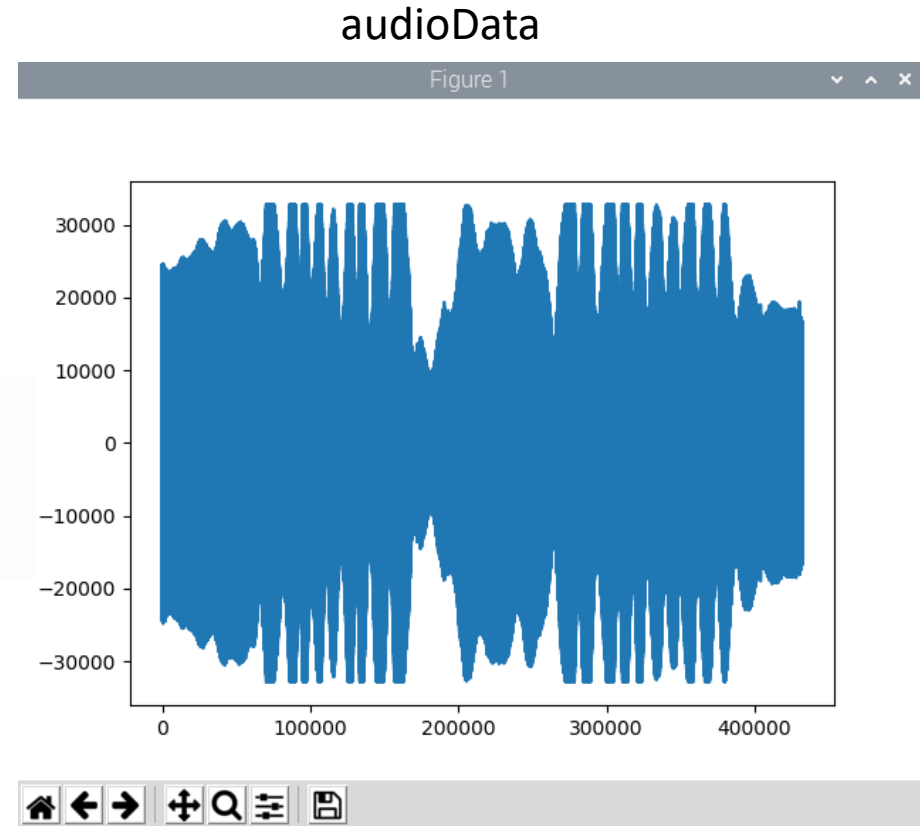

audioDataRaw

Get Middle Part of Audio Data

- The start and end of the experiment may be unstable. Thus we use the middle part of the audio file.

```
# cut the middle part of the audio data
timeOffset = 2
totalTime = np.int32(np.ceil(audioDataRowTotalTime - timeOffset - 2))
totalPoint = totalTime*sf
timeOffsetPoint = timeOffset*sf
audioData = audioDataRow[range(timeOffsetPoint, timeOffsetPoint+totalPoint)]
```

Recall the Key Steps

1. Derive In-phase signal I.

- Multiply received signal with $\cos(2\pi ft)$
- Apply a low-pass filter

2. Derive Quadrature signal Q.

- Multiply received signal with $-\sin(2\pi ft)$
- Apply a low-pass filter

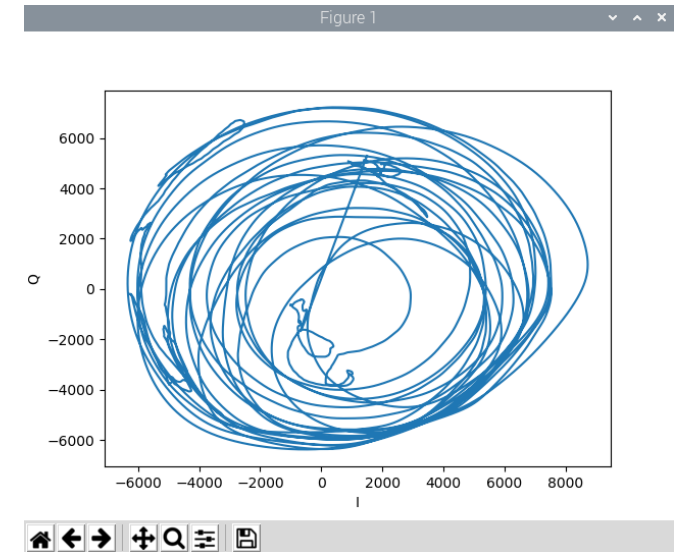

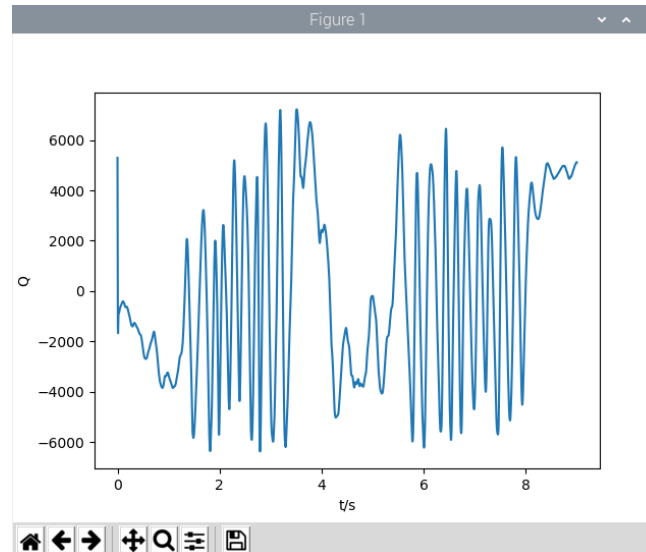

3. Calculate the phase using I and Q.

4. Convert phase change to distance change.

```
# set frequency
freq = 18000
# calculate time t
t = np.arange(totalPoint)/sf
# get cos and -sin used in demodulation
signalCos = np.cos(2*np.pi*freq*t)
signalSin = -np.sin(2*np.pi*freq*t)
# get a butterworth filter
b, a = signal.butter(3, 50/(sf/2), 'lowpass')
# multiply received signal (audioData) and demodulation signal, also apply the filter
signalI = signal.filtfilt(b,a, audioData*signalCos)
signalQ = signal.filtfilt(b,a, audioData*signalSin)
# remove static vector
signalI = signalI - np.mean(signalI)
signalQ = signalQ - np.mean(signalQ)
# calculate the phase angle
phase = np.arctan(signalQ/signalI)
# unwrap the phase angle
phase = np.unwrap(phase*2)/2
# calculate the wave length
waveLength = 342/freq
# calculate distance
distance = phase/2/np.pi*waveLength/2
```

Calculate I and Q

```
# set frequency
freq = 18000
# calculate time t
t = np.arange(totalPoint)/sf
# get cos and -sin used in demodulation
signalCos = np.cos(2*np.pi*freq*t)
signalSin = -np.sin(2*np.pi*freq*t)
# get a butterworth filter
b, a = signal.butter(3, 50/(sf/2), 'lowpass')
# multiply received signal (audioData) and demodulation signal, also apply the filter
signalI = signal.filtfilt(b,a,audioData*signalCos)
signalQ = signal.filtfilt(b,a,audioData*signalSin)
```

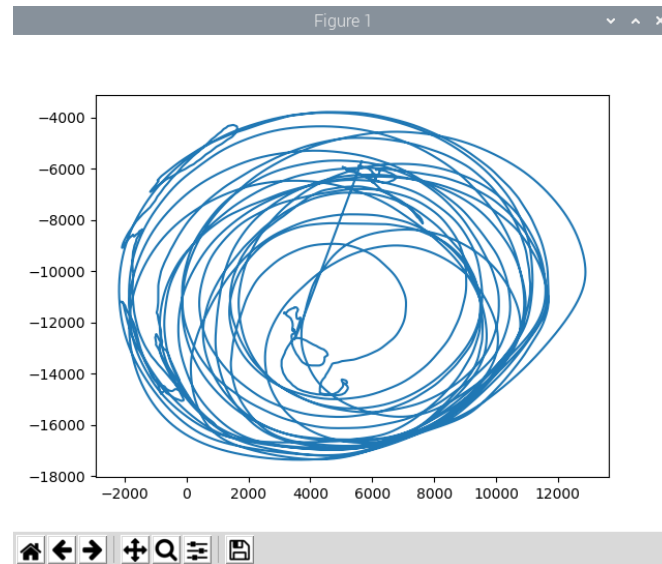

Remove Static Vector

```
# remove static vector  
signalI = signalI - np.mean(signalI)  
signalQ = signalQ - np.mean(signalQ)
```

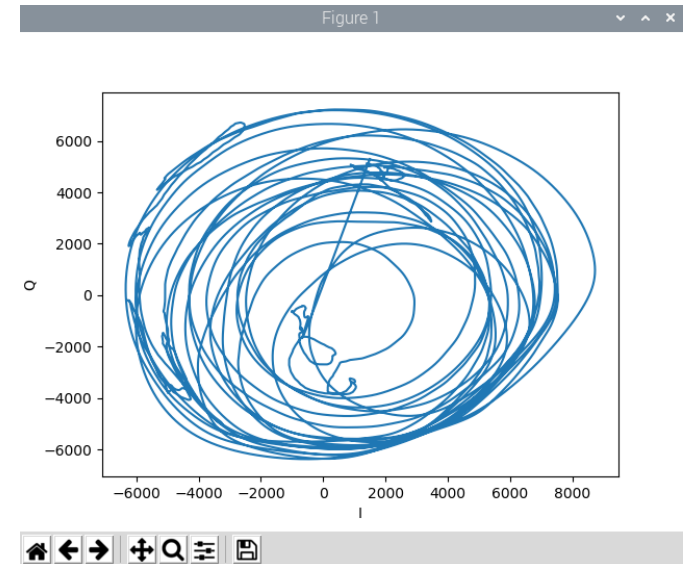

(b) Complex I/Q traces

Before removal

after removal

Derive Phase Angle and Unwrap

- Unwrap to solve the problem of boundary $0/2\pi$ ($-\pi/\pi$).

```
# calculate the phase angle
phase = np.arctan(signalQ/signalI)
# unwrap the phase angle
phase = np.unwrap(phase*2)/2
```

Without unwrap

With unwrap

Calculate Distance by Phase

- 2π change in phase is distance change of a wavelength.

```
# calculate the wave length  
waveLength = 342/freq  
# calculate distance  
distance = phase/2/np.pi*waveLength/2
```

CORRELATION BASED FREQUENCY MODULATED CONTINUOUS WAVE METHOD (C-FMCW) BASED DISTANCE TRACKING

What is a chirp?

An FMCW radar transmits a signal called a “chirp”. A chirp is a sinusoid whose frequency increases linearly with time, as shown in the Amplitude vs time (or ‘A-t’ plot) here.

- A frequency vs time plot (or ‘f-t plot’) is a convenient way to represent a chirp.
- A chirp is characterized by a start frequency (f_c), Bandwidth(B) and duration (T_c).
- The Slope (S) of the chirp defines the rate at which the chirp ramps up. In this example the chirp is sweeping a bandwidth of 4 GHz in 40 us which corresponds to a Slope of 100 MHz/us

Range Distance Resolution

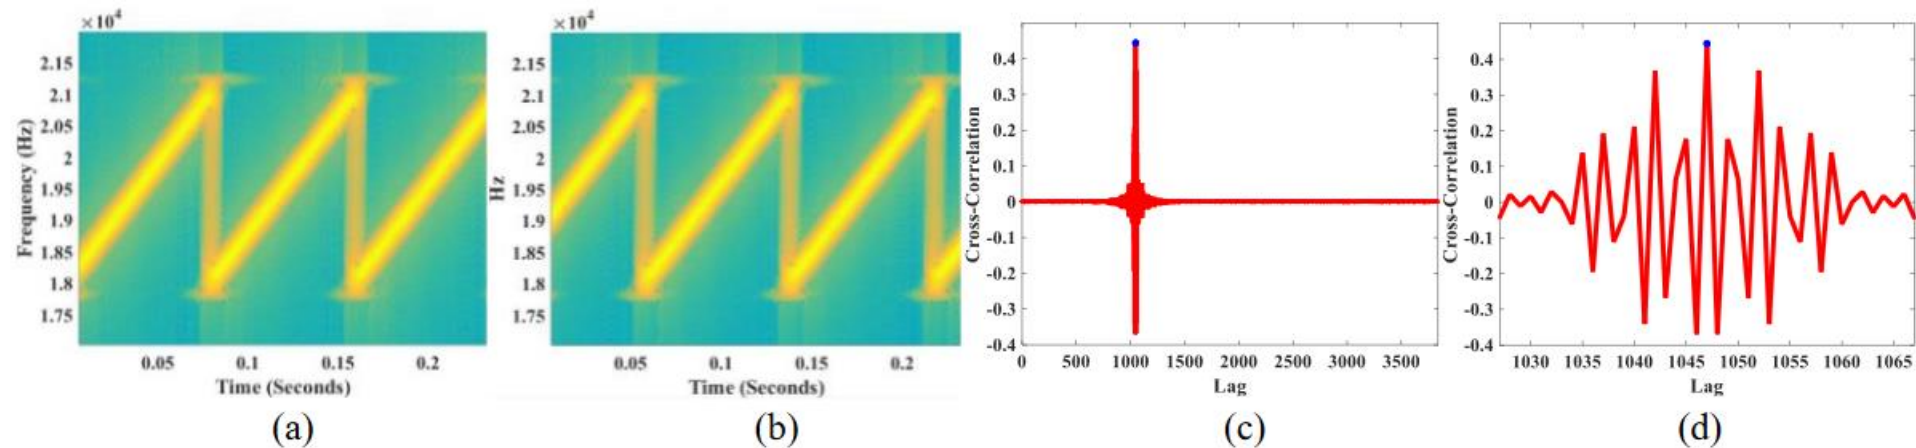

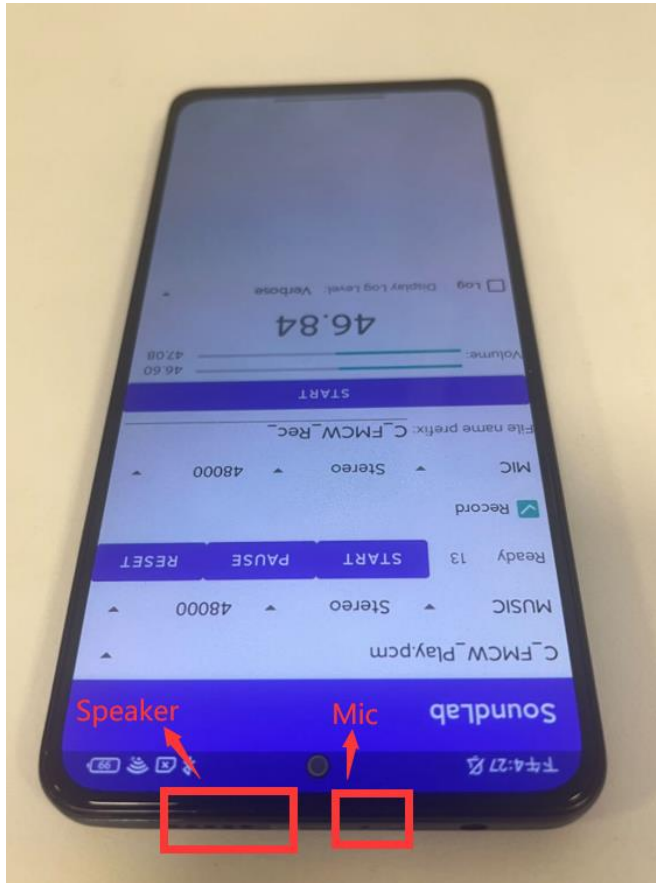

Fig. 2. Cross-correlation function of transmitted and received chirp signals with delay. (a) transmitted signal. (b) received signal with delay. (c) cross-correlation function of transmitted and received signals. (d) enlarged view round the peak of (c)

$$\delta R = \frac{C \cdot \delta Lag}{2F_s} = \frac{C}{2F_s}$$

$$\delta R = \frac{C}{2F_s} = \frac{343}{2 \times 48000} = 0.00357 \text{ m} = 0.357 \text{ cm}$$

Experimental Settings

$f_s = 48\text{e}3$

Chirp:

$f_1 = 18\text{e}3$

$f_2 = 22\text{e}3$

$N = 256$

Idle time length: 256

Flag:

$f_1 = 22\text{e}3$

$f_2 = 18\text{e}3$

$N = 8192$

Signal Transceivers

Transmitted signal

Received signal

Synchronization

Synchronization through direct path propagation (xcorr).

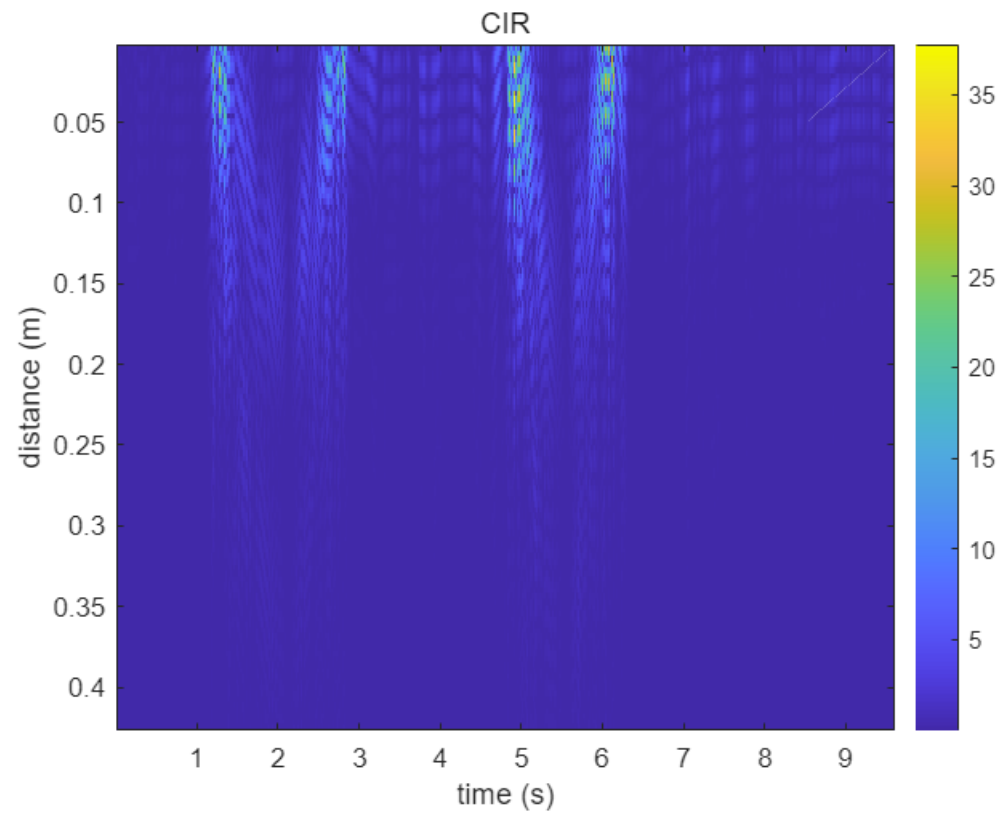

Static Elimination

We eliminate the static components by subtracting the current chirp from its previous one.

Example

Homework

Move your hands **back and forth twice**, and track the distance change of your hand using **C-FMCW**. Draw a graph of the distance change of your hand, horizontal coordinates in s, vertical coordinates in m.

You can either collect the data yourself or use the given data **C_FMCW_Rec_1.pcm**

Pack your codes, figure and audio files into SID.zip. Hand in your SID.zip in bb system.
